

Message from the CEO

Aiding the development of ideas into research that addresses strategic industry need is a most interesting process, and recently ACRI has been working with its participants to formulate a range of new research initiatives to complement the research currently in delivery.

Ideas for new research may come from one government or private sector stakeholder within the ACRI research groups covering heavy haul, level crossing and passenger/freight issues. Then, with the knowledge of both the wider participant base and ACRI's research partners, the idea develops into a research initiative that will have strategic benefit for the Australasian rail industry.

Currently on ACRI website (LINK?), with selected highlights in this newsletter, is the range of ACRI research in both development and delivery phases. Comment is most welcome.

You may be aware of initiatives within rail that if incorporated now into the research planning could greatly benefit the strategic outcome.

Or you may know of a technology not yet applied to the rail sector but which may have potential application to the issues identified in ACRI's research program?

ACRI invites your feedback to maximise the impact of its research on the safety, efficiency and sustainability of the Australasian rail industry.
